AUTOSOL

Overview

The ACM Mobile Portal (AMP) is a web-based application designed to provide access to ACM reports and device information in a platform-independent way. The responsive UI design conforms to many modern web browsers, device screen sizes and operating systems. There is no need to install any files on client devices wishing to use the application.

Security

AMP is designed to work with the existing ACM security model. Users must login and authenticate through ACM. Once authenticated, AMP creates a session for the user and authorizes access to application pages. Users can be configured as administrators, which allows administrative page access during the session. ACM Users and Roles are enforced per task, such as execution of device commands or changing supported configuration properties.

General Features

- View reports. Report parameter options are supported allowing report data to be filtered if present. Administrators can choose which reports are visible.
- View archive history records collected by a meter. Record types include Meter Characteristics, Hourly, Daily and Event. Searches for periodic records can be done by date and time ranges.
- Find devices by using filters and search phrases on device configuration fields such as Name, Description, Comments, Meter Name and most meta data fields like Location or Technician name. Results can be pinned/bookmarked by user for quick access from the home dashboard.
- View and edit protocol device configuration properties (limited). ACM security is enforced as configured. Administrators can choose which properties are visible.
- Execute commands and view the status results. ACM security is enforced as configured. Administrators can choose which commands are visible.
- Perform ad hoc alias demand poll requests for the device and view the results. Administrators can choose which alias groups are visible.
- View any persisted item values stored in ACM for the device.

Administrative Features

- Manage a portal message that shows on all user dashboards.
- Manage the portal software license.
- Choose how long user sessions last.
- Choose how to treat invalid login attempts.
- Choose how to persist user session activity.
- Choose which reports are visible.
- Choose which device configuration properties are visible.
- Choose which commands are visible.
- Choose which alias groups are visible.
- Observe licensed user sessions and manage locked users.
